**SUBSTITUTED QUINAZOLINONES AS ANGIOTENSIN II ANTAGONISTS**

**INTRODUCTION OF THE INVENTION**

This invention relates to novel substituted quinazolinone compounds and derivatives thereof which are useful as angiotensin II antagonists in the treatment of elevated blood pressure and congestive heart failure.

5 Thus, the substituted quinazolinone compounds of the invention are useful as antihypertensives.

**BACKGROUND OF THE INVENTION**

10 Renin-angiotensin system (RAS) plays a central role in the regulation of normal blood pressure and seems to be critically involved in hypertension development and maintenance as well as congestive heart failure. Angiotensin II (All), an octapeptide hormone is produced mainly in the blood during the cleavage of angiotensin I by angiotensin converting enzyme (ACE) localized on the endothelium of blood vessels of lung, kidney, and many other organs, and is the end product of the RAS. All is a powerful arterial  
15 vasoconstrictor that exerts its action by interacting with specific receptors present on cell membranes. One of the possible modes of controlling the RAS is angiotensin II receptor antagonism. Several peptide analogs of All are known to inhibit the effect of this hormone by competitively blocking the receptors, but their experimental and clinical applications have been limited by their partial agonist activity and lack of oral absorption [M. Antonaccio, Clin. Exp. Hypertens. A4, 27-46 (1982); D. H. P. Streeten and G. H. Anderson,  
20 Jr. - Handbook of Hypertension, Clinical Pharmacology of Antihypertensive Drugs, ed. A. E. Doyle, Vol. 5, pp. 246-271, Elsevier Science Publisher, Amsterdam, The Netherlands, 1984].

Recently, several non-peptide compounds have been described as All antagonists. Illustrative of such compounds are those disclosed in U.S. Patents 4,207,324; 4,340,598; 4,576,958; 4,582,847 and 4,880,804 in European Patent Applications 028,834; 245,637; 253,310; and 291,969; and in articles by A.T. Chiu, et al. [  
25 Eur. J. Pharm. Exp. Therap., 157, 13-21 (1988)] and by P.C. Wong, et al. [J. Pharm. Exp. Therap., 247, 1-7(1988), Hypertension, 13, 489-497 (1989)]. All of the U.S. Patents, European Patent Applications 028,834 and 253,310 and the two articles disclose substituted imidazole compounds which are generally bonded through a lower alkyl bridge to a substituted phenyl. European Patent Application 245,637 discloses derivatives of 4,5,6,7-tetrahydro-2H-imidazo[4,5-c]pyridine-6-carboxylic acid and analogs thereof as antihypertensive agents.

**DETAILED DESCRIPTION OF THE INVENTION**

Scheme 1 illustrates the preparation of 1,2-disubstituted quinazolin-4(1H)-ones of Formula 1 wherein J = -C(O)- and E is a single bond. An appropriately substituted anthranilonitrile is acylated using the requisite acyl chloride. The resulting amide is alkylated with sodium hydride and the appropriate alkyl halide (or pseudohalide). The resulting tertiary amide is then rearranged/cyclized with basic hydrogen peroxide<sup>1</sup>. 2-Substituted quinazolin-4(1H)-ones 6 wherein E is a single bond and K is -C(O)- may be prepared from substituted anthranilonitriles as described in Scheme 1. The appropriately substituted anthranilonitrile is acylated using the requisite acyl chloride to give 2 then cyclized with basic hydrogen peroxide to give 6.

The benzyl halides (3) including the more preferred alkylating agents (9a and 9b, Reaction Scheme 2) can be prepared as described in European Patent Applications 253,310 and 291,969 and the references cited therein. However, a preferred method to prepare the biphenyl precursors 8a, 8b and 8c using Ni(O) or Pd(O) catalyzed cross-coupling reaction [E. Negishi, T. Takahashi, and A. O. King, *Org. Synthesis*, 66, 45 67 (1987)] is outlined in Reaction Scheme 2. As shown in Reaction Scheme 2, treatment of 4-bromotoluene (4a) with t-BuLi, followed by the addition of a solution of ZnCl<sub>2</sub>, produces the organo-zinc compound (6a). Compound (6a) is then coupled with 7a or 7b or in the presence of Ni(PPh<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub> catalyst to produce the desired biphenyl compound 8a or 8b (PPh<sub>3</sub> = triphenylphosphine). Similarly, 1-iodo-2-nitro-benzene (7c) is 50 coupled with organo-zinc compound 6a in the presence of Pd(PPh<sub>3</sub>)<sub>4</sub> catalyst [prepared by treating Cl<sub>2</sub>Pd-(PPh<sub>3</sub>)<sub>2</sub> with (i-Bu)<sub>2</sub>AlH (2 equiv.)] to give the biphenyl compound 8c. These precursors, 8a, and 8b and 8c, are then transformed into halomethylbiphenyl derivatives 9a, 9b and 9c, respectively, according to 55 procedures described in European Patent Applications 253,310 and 291,969.

When there is additional substitution on the second phenyl ring ( $R^{2a}$ ,  $R^{2b} \neq$  hydrogen) the preferred method to prepare the biphenyl precursors  $8d$  and  $8e$ , using the Pd(O) catalyzed cross-coupling reaction [J. K. Stille, Angew. Chem. Int. Ed. Engl., 25, 508 (1986)], is outlined in reaction Scheme 2a. As shown in reaction Scheme 2a, p-tolyltrimethyltin ( $6a$ ) is coupled with  $7d$  or  $7e$  in refluxing toluene in the presence of 5 mole % of  $Pd(PPh_3)_4$  to produce the desired biphenyl compounds  $8d$  and  $8e$ . Table I illustrates the

synthetic utility of this protocol. Compounds 8d ( $R^2 = NO_2$ ) and 8e ( $R^2 = NO_2$ ) could be converted to their respective chlorides by catalytic hydrogenation, diazotization and treatment with copper (I) chloride. The biphenyl fluorides which could not be obtained by direct coupling to a fluoro arylbromide were prepared from 8d ( $R^2 = NO_2$ ) and 8e ( $R^2 = NO_2$ ) via reduction, formation of the diazonium tetrafluoroborate salt and thermal decomposition. These precursors 8d ( $R^2 = NO_2$  or F or Cl) and ( $R^2 = NO_2$  or F or Cl) are then transformed into the halomethyl biphenyl derivatives 9d and 9e, respectively according to the procedures described in European Patent Applications 253,310 and 292,969.

Biphenyl Synthesis Table I

**Scheme 3** shows an alternate preparation of 2-substituted quinazolin-4(3H)-ones (6) starting with the corresponding anthranilic acid. The appropriately substituted anthranilic acid (10) is treated with two equivalents of the requisite acyl chloride in DMF with triethylamine and DMAP at 0 °C. This is then heated to 110 °C for two hours after which time excess ammonium carbonate is added.<sup>2</sup>

SCHEME 3

15

Scheme 4 illustrates the general preparation of 2,3-disubstituted quinazolin-4(3H)-ones (11a) of Formula (I) wherein E is a single bond and K is -C(O)-. An appropriately substituted 2-substituted quinazolin-4(1H)-one (6) (see Scheme 1 or Scheme 3) is alkylated using sodium hydride and the appropriate alkyl halide (or pseudohalide). This reaction sometimes gives some O-alkylated product, generally less than 20% of the isolated reaction products.

SCHEME 4

45

Schemes 5, 6, and 7 provide an alternate route to compounds of Formula (1) (11b) wherein E is a single bond, K is -C(O)-, and r is 1 or 2.

Two methods for preparing 3,1,4-benzoxazones (10) are illustrated in Scheme 5. Substituted anthranilic acids (10) may be acylated and cyclized by heating them in DMF with an acyl chloride, triethylamine and DMAP.<sup>3</sup> Alternatively, they may also be prepared by heating an appropriately substituted anthranil (13) with an acyl chloride in pyridine.<sup>4</sup>

50 The necessary alkyl amine may then be prepared from the alkyl halide (or pseudohalide) using the standard literature procedures (Scheme 6)<sup>5</sup>. The amine where r = 2 may be prepared from (9a-e) using procedures known to those skilled in the art where appropriate protecting groups are used for R<sup>1</sup>, R<sup>2a</sup>, R<sup>2b</sup>, R<sup>3a</sup> and R<sup>3b</sup>. Then, the amine and the 3,1,4-benzoxazone are heated together to give the desired 2,3-disubstituted quinazolinone (11b) (Scheme 7).

Substituted 2-alkylthioquinazolin-4(3H)-ones wherein K is -C(O)- and E is -S- (15) may be prepared from their corresponding substituted anthranilic acids as shown in Scheme 8. The amine (14) from Scheme 6 can be converted to its isothiocyanate (16) upon treatment with thiophosgene. This may then be reacted with an appropriately substituted anthranilic acid to give the desired 3-alkyl-2-mercaptop-quinazolin-4(3H)-one.(17)<sup>6</sup> A second alkylation of the mercapto group then gives the desired 2-alkylthio-3-alkylquinazolin-4(3H)-one. Similarly, 2-alkoxyquinazolin-4(3H)-ones wherein K is -C(O)- and E is -O- may be prepared from their corresponding substituted anthranilic acids as shown in Scheme 9.<sup>8</sup> Alkylation with the appropriate alkyl halide 9a-e according to the methods developed by Lange and Sheibley<sup>9</sup> then gives the final product 19.

SCHEME 9

Scheme 10 illustrates a route to the isomeric 1,2-disubstituted quinazolin-4(1H)-ones (20) wherein J is -C(O)- and where E is S or O. An anthranilonitrile 1 is acylated with an alkyl haloformate or an alkylthiol haloformate to give 21.<sup>10</sup> This may then be deprotonated and alkylated with the appropriate alkyl halide to give the intermediate carbamate nitrile 22.<sup>11</sup> Conversion of the intermediate then occurs when the material is treated with basic hydrogen peroxide to yield the desired product 20.

SCHEME 10

**Scheme 11** illustrates the method by which a 2-amino-3-alkylquinazolinone 23 can be made. The 2-mercaptopquinazolinone (17) shown in **Scheme 8** can be treated with sulfonyl chloride to give the corresponding 2-chloroquinazolinone 24.<sup>12</sup> Displacement of the chloride with an R<sup>6</sup> amine then gives 23 with E = NH.<sup>13</sup>

SCHEME 11

40 Scheme 12 illustrates the method by which a 2-amino-1-alkylquinazolinone 24 can be made. The products from Scheme 10 where E is sulfur (20) can be used as a synthetic intermediate if the initial  $R^6$  is a protecting group such as benzyl or t-butyl.<sup>14</sup> Deprotection and subjection of the resulting 2-mercaptop-1-alkyl-quinazolinone to the same conditions used in Scheme 11 will result in the formation of the desired 2-amino-1-alkylquinazolinone. Alternatively, the sulfide may be displaced directly by an  $R^6$  amine as shown in  
45 Scheme 13 ( $R^6-S-$  and  $R^6-NH_2$  may or may not have the same  $R^6$ ).

SCHEME 12

35 SCHEME 13

Scheme 14 illustrates the method by which a quinazolin-4(3H)-imine 27 may be prepared. A 3-substituted or unsubstituted quinazolin-4(3H)-one can be converted to a quinazolin-4(3H)-thione 26 by the action of Lewesson's reagent. Addition of amine and heating will result in the formation of an imine 27 as shown.

SCHEME 14

Compounds of formula I where R<sup>1</sup> is -CONHSO<sub>2</sub>R<sup>23</sup> (where R<sup>23</sup> = alkyl, aryl or heteroaryl) may be prepared from the corresponding carboxylic acid derivatives (28) as outlined in Scheme 15. The carboxylic acid (28), obtained as described in Scheme 4, can be converted into the corresponding acid chloride by treatment with refluxing thionyl chloride or preferably with oxalychloride and a catalytic amount of dimethylformamide at low temperature [A.W. Burgstahler, L.O. Weigel, and C.G. Shaefer- Synthesis, 767, (1976)]. The acid chloride then can be treated with the alkali metal salt of R<sup>23</sup>SO<sub>2</sub>NH<sub>2</sub> to form the desired acylsulfonamide 29. Alternatively, these acylsulfonamides may be also prepared from the carboxylic acids using N,N-diphenylcarbamoyl anhydride intermediates [F.J. Brown et al., European Patent Application, EP 199543; K.L. Shepard and W. Halzenko- J. Het. Chem., 16, 321 (1979)]. Preferably the carboxylic acids can be converted into acyl-imidazole intermediates, which then can be treated with an appropriate aryl or alkylsulfonamide and diazabicycloundecane (DBU) to give the desired acylsulfonamide 29 [J.T. Drummond and G. Johnson, Tet. Lett., 29, 1653 (1988)].

Compounds of formula I where  $R^1$  is  $\text{SO}_2\text{NHCOR}^{23}$  may be prepared as outlined in Scheme 16. The nitro compound 8c (prepared as described in Scheme 2) can be reduced to the corresponding amino compound and converted into aromatic diazonium chloride salt, which then can be reacted with sulfur dioxide in the presence of a copper (II) salt to form the corresponding arylsulfonyl chloride 30 [H. Meerwein, G. Dittmar, R. Gollner, K. Hafner, F. Mensch and O. Steifort, *Chem. Ber.*, 90, 841 (1957); A.J. Prinsen and H. Cerfontain, *Recueil*, 84, 24 (1965); E.E. Gilbert, *Synthesis*, 3 (1969) and references cited therein]. The sulfonyl chloride can be reacted with ammonia in aqueous solution or in an inert organic solvent [F.H. Bergheim and W. Baker, *J. Amer. Chem. Soc.*, 66, (1944), 1459], or with dry powdered ammonium

carbonate, [E.H. Huntress and J.S. Autenrieth, J. Amer. Chem. Soc., 63 (1941), 3446; E.H. Huntress and F.H. Carten, J. Amer. Chem. Soc., 62, (1940), 511] to form the sulfonamide 31. The benzylbromide 33 may be prepared from the sulfonamide 31 as outlined in Scheme 16, and then can be reacted with an alkali metal salt of an appropriate heterocyclic compound to form the key sulfonamide 34. The sulfonamide 34 may be also prepared from the aromatic sulfonyl chloride 39, which may be prepared from the aryl amine 38 as outlined in Scheme 17. The acylation of 34 with appropriate acyl chlorides (or acyl-imidazoles or other acylating agents) may produce the desired acylsulfonamides 35.

The compounds bearing R<sup>1</sup> as -SO<sub>2</sub>NHR<sup>23</sup> (where R<sup>23</sup> is heteroaryl) may be prepared by reacting the aromatic sulfonyl chloride 39 with appropriate heteroaryl amines as outlined in Scheme 17. The sulfonyl chloride 39 may be the preferred intermediate for the synthesis of this class of compounds. The aromatic sulfonyl chlorides may also be prepared by reacting the sodium salt of aromatic sulfonic acids with PCls or POCl<sub>3</sub> [C.M. Suter, The Organic Chemistry of Sulfur, John Wiley & Sons, 459, (1944)]. The aromatic sulfonic acid precursors may be prepared by chlorosulfonation of the aromatic ring with chlorosulfonic acid [E.H. Huntress and F.H. Carten, J. Amer. Chem. Soc., 62, 511 (1940)].

The biaryl sulfonamides 31 and 32 (described in Scheme 16) can be prepared alternatively using palladium(0) catalyzed cross-coupling reactions of appropriate aryl-organotin precursors [J.K. The compounds bearing  $\text{R}^1 = -\text{CH}_2\text{SO}_2\text{NHCOR}^{23}$  and  $-\text{CH}_2\text{SO}_2\text{NHR}^{23}$  may be prepared as outlined in Scheme 20. The key precursor aryl-methanesulfonyl chloride 56 may be prepared either from the reaction of arylmethylmagnesium chloride 55, obtained from the corresponding benzyl chloride 52, with sulfonyl chloride [S.N. Bhattacharya, C. Earborn and D.P.M. Walton, *J. Chem. Soc. C*, 1265 (1968)], or by oxidation of the aryl-methylthioacetate 54 (prepared from the benzyl bromide 53 with chlorine in presence of trace amount of water [Bagnay and Dransch, *Chem. Ber.*, 93, 784 (1960)]). Alternatively, the aryl-methylthioacetate 54 can be oxidized with sulfonyl chloride in presence of acetic anhydride to form arylmethylsulfinyl chloride [S. Thea and G. Cevasco, *Tetra. Lett.*, 28, 5193 (1987)], which can be further oxidized with appropriate oxidizing agents to give the sulfonyl chloride 56. The compounds 57 and 58 can be obtained by reacting the sulfonyl chloride 56 with appropriate amines.

Compounds where  $\text{R}^1 = -\text{NSO}_2\text{NHR}^{23}$  may be prepared by the reaction of appropriate primary amines with the sulfamide 60 [S.D. McDermott and W.J. Spillane, *Synthesis*, 192 (1983)], as described in Scheme 21. The compound 60 may be obtained from the corresponding N-t-butylsulfamide 59 after treatment with anhydrous trifluoroacetic acid [J.D. Catt and W.L. Matier, *J. Org. Chem.*, 566 (1974)], which may be prepared by the reaction of the aromatic amine 38 with t-butylsulfamoyl chloride [W.L. Matier, W.T. Comer and D. Deitchman, *J. Med. Further functionalization of compounds of Formula 1 where R<sup>8a</sup> and R<sup>8b</sup> is nitro is available through the following route (Scheme 22). The nitro group of 62 may be reduced to the amine 63 by reduction with hydrogen over palladium on carbon. The amine may then be acylated with acid chlorides to give amides under basic conditions. The acylation of the amine with chloroformates is best carried out in the presence of sodium hydride to form the anilinium anion. This anion reacts quickly with chloroformates to give the carbamates 64. The carbamate may be isolated and then deprotonated with lithium hexamethyldisilazide and alkylated to give the N,N-dialkylated carbamates 65. Alternatively this process may be carried out in

one pot by first preforming the anilinium anion, acylating it and then deprotonating *in situ* and alkylating with R<sup>4</sup> iodide group to give 65. The amine reacts slowly with isocyanates to give ureas 66. Trisubstituted ureas 67 may be prepared from the benzyl carbamate 64 (R<sup>23</sup> = benzyl) by treatment with the magnesium salt of a secondary amine. The trisubstituted ureas may be N-alkylated by deprotonation with lithium hexamethyl-disilazide and alkylation with an R<sup>4</sup> iodide to give 68. The amine may be further derivatized or converted to other groups by means of chemical procedures well known to those skilled in the art.

 It will be appreciated by those skilled in the art that the protecting groups used in these syntheses will be chosen to be compatible with subsequent reaction conditions. Ultimately, they will be removed to generate the active compounds of formula (I). For example, R<sup>1</sup> as carboxyl is often protected as its t-butyl ester which in the last step is removed by treatment with trifluoroacetic acid. Aqueous acetic acid employed overnight is a preferred method to remove a trityl protecting group to liberate an R<sup>1</sup> tetrazole group.

The compounds of this invention form salts with various inorganic and organic acids and bases which are also within the scope of the invention. Such salts include ammonium salts, alkali metal salts like sodium and potassium salts, alkaline earth metal salts like the calcium and magnesium salts, salts with organic bases; e.g., dicyclohexylamine salts, N-methyl-D-glucamine, salts with amino acids like arginine, lysine, and the like. Also, salts with organic and inorganic acids may be prepared; e.g., HCl, HBr, H<sub>2</sub>SO<sub>4</sub>, H<sub>3</sub>PO<sub>4</sub>, methane-sulfonic, toluensulfonic, maleic, fumaric, camphorsulfonic. The non-toxic, physiologically, acceptable salts are preferred, although other salts are also useful; e.g., in isolating or purifying the product.

The salts can be formed by conventional means such as by reacting the free acid or free base forms of the product with one or more equivalents of the appropriate base or acid in a solvent or medium in which the salt is insoluble or in a solvent such as water which is then removed in vacuo or by freeze-drying or by exchanging the cations of an existing salt for another cation on a suitable ion exchange resin.

Angiotensin II (All) is a powerful arterial vasoconstrictor, and it exerts its action by interacting with specific receptors present on cell membranes. The compounds described in the present invention act as competitive antagonists of All at the receptors. In order to identify All antagonists and determine their efficacy in vitro , the following two ligand-receptor binding assays were established.

#### Receptor binding assay using rabbit aortae membrane preparation:

45 Three frozen rabbit aortae (obtained from Pel-Freeze Biologicals) were suspended in 5mM Tris-0.25M Sucrose, pH 7.4 buffer (50 ml) homogenized, and then centrifuged. The mixture was filtered through a cheesecloth and the supernatant was centrifuged for 30 minutes at 20,000 rpm at 4 °C. The pellet thus obtained was resuspended in 30 ml of 50mM Tris-5 mM MgCl<sub>2</sub> buffer containing 0.2% Bovine Serum Albumin and 0.2 mg/ml Bacitracin and the suspension was used for 100 assay tubes. Samples tested for screening were done in duplicate. To the membrane preparation (0.25 ml) there was added <sup>125</sup>I-Sar<sup>1</sup>Ile<sup>8</sup>-angiotensin II [obtained from New England Nuclear] (10μl; 20,000 cpm) with or without the test sample and the mixture was incubated at 37 °C for 90 minutes. The mixture was then diluted with ice-cold 50mM Tris-0.9% NaCl, pH 7.4 (4ml) and filtered through a glass fiber filter (GF/B Whatman 2.4" diameter). The filter was soaked in scintillation cocktail (10 ml) and counted for radioactivity using Packard 2660 Tricarb liquid scintillation counter. The inhibitory concentration (IC<sub>50</sub>) of potential All antagonist which gives 50displacement of the total specifically bound <sup>125</sup>I-Sar<sup>1</sup>Ile<sup>8</sup>-angiotensin II was presented as a measure of the efficacy of such compounds as All antagonists.

Receptor assay using Bovine adrenal cortex preparation

Bovine adrenal cortex was selected as the source of All receptor. Weighed tissue (0.1 g is needed for 100 assay tubes) was suspended in Tris.HCl (50mM), pH 7.7 buffer and homogenized. The homogenate 6 was centrifuged at 20,000 rpm for 15 minutes. Supernatant was discarded and pellets resuspended in buffer [Na<sub>2</sub>HPO<sub>4</sub> (10mM)-NaCl (120mM)-disodium EDTA (5mM) containing phenylmethane sulfonyl fluoride (PMSF)(0.1mM)]. (For screening of compounds, generally duplicates of tubes are used). To the membrane preparation (0.5 ml) there was added <sup>3</sup>H-angiotensin II (50mM) (10μl) with or without the test sample and the mixture was incubated at 37° C for 1 hour. The mixture was then diluted with Tris buffer (4ml) and 10 filtered through a glass fiber filter (GF/B Whatman 2.4" diameter). The filter was soaked in scintillation cocktail (10ml) and counted for radioactivity using Packard 2660 Tricarb liquid scintillation counter. The inhibitory concentration (IC<sub>50</sub>) of potential All antagonist which gives 50% displacement of the total specifically bound <sup>3</sup>H-angiotensin II was presented as a measure of the efficacy of such compounds as All antagonists.

15 The potential antihypertensive effects of the compounds described in the present invention may be evaluated using the methodology described below:

Male Charles River Sprague-Dawley rats (300-375 gm) were anesthetized with methohexitol (Brevital; 50 mg/kg i.p.) and the trachea was cannulated with PE 205 tubing. A stainless steel pithing rod (1.5 mm thick, 150 mm long) was inserted into the orbit of the right eye and down the spinal column. The rats were 20 immediately placed on a Harvard Rodent Ventilator (rate - 60 strokes per minute, volume -1.1 cc per 100 grams body weight). The right carotid artery was ligated, both left and right vagal nerves were cut, and the left carotid artery was cannulated with PE 50 tubing for drug administration, and body temperature was maintained at 37° C (by a thermostatically controlled heating pad which received input from a rectal temperature probe. Atropine (1 mg/kg i.v.) was then administered, and 15 minutes later propranolol (1 25 mg/kg i.v.). Thirty minutes later angiotensin II or other agonists were administered intravenously at 30-minute intervals and the increase in the diastolic blood pressure was recorded before and after drug or vehicle administration.

Using the methodology described above, representative compounds of the invention were evaluated and were found to exhibit an activity of at least IC<sub>50</sub><50μM thereby demonstrating and confirming the utility 30 of the compounds of the invention as effective All antagonists.

A 1 L three-necked 24/40 round-bottom flask equipped with a mechanical stirrer, a 250 mL constant pressure addition funnel with a nitrogen inlet at the top, and a septum was flame dried, cooled and then 45 charged with a solution of 29.07 g (0.17 mol) of p-bromotoluene in 100 mL of anhydrous tetrahydrofuran under a nitrogen atmosphere. The solution was stirred and cooled to  $-78^\circ\text{C}$  and 200 mL (0.34 mol) of a 1.7 M solution of t-butyllithium in pentane was added via the addition funnel over 30 minutes. When the addition was complete, the cooling bath was removed and the reaction mixture was stirred for 30 minutes and allowed to warm to room temperature. The dropping funnel was next charged with 170 mL (0.17 mol) of 50 a 1.0 M solution of zinc chloride in diethylether which was added to the reaction mixture over a 10 minute period. A separate 1 L three-necked 24/40 round-bottom flask equipped with a mechanical stirrer, a nitrogen inlet and a septum, was flame dried, cooled and then charged with 4.04 g (6.0 mmol) of bis-(triphenylphosphine)palladium(II) chloride and 50 mL of anhydrous tetrahydrofuran under a nitrogen atmosphere. The stirrer was started and 8.0 mL of a 1.5 M solution (12 mmol) of diisobutylaluminum hydride 55 in toluene was added to the suspension via syringe. The catalyst was stirred an additional 10 minutes at room temperature, and then a solution of 23.23 g (0.115 mol) of 1-bromo-2-nitrobenzene in 100 5mL of anhydrous tetrahydrofuran was added. The suspension of the tolylzinc chloride was then transferred to the second flask via a wide diameter cannula. The reaction mixture was stirred an additional 45 minutes at room

temperature, then most of the tetrahydrofuran was removed on a rotary evaporator. The resulting oil was partitioned between ethyl acetate and 1.0 N hydrochloric acid. The organic layer was washed successively with water and brine, then dried ( $\text{MgSO}_4$ ), filtered and evaporated. The residual oil was purified on a silica gel flash chromatography column eluted with 10% ethyl acetate-hexane to afford after-evaporation and 5 drying in *vacuo* 15.43 g (63%) of the product as a viscous yellow oil: NMR ( $\text{CDCl}_3$ ):  $\delta$  2.36 (s, 3H), 7.16-7.24 (m, 4H), 7.38-7.46 (m, 2H), 7.55-7.62 (m, 1H), 7.80 (d,  $J=10$  Hz, 1H); MS (FAB) m/e 214 ( $\text{MH}^+$ ).

Step 2: 4-Bromomethyl-2'-nitrobiphenyl

10 A 2 L 24/40 three necked round-bottom flask equipped with a mechanical stirrer, a reflux condenser and a stopper, was charged with 15.427 g (72 mmol) of 4-methyl-2'-nitro[1,1'-biphenyl], 1.2 L of carbon tetrachloride, 14.164 g (80 mmol) of N-bromosuccinimide, and 0.50 g of 2,2'-azobis-(2-methylpropionitrile). The stirred reaction mixture was refluxed under a nitrogen atmosphere for 4 hours, then cooled to room 15 temperature and filtered. The filtrate was evaporated *in vacuo* and the residual oil was purified on a silica gel flash chromatography column eluted with 10% ethyl acetate-hexane. Evaporation of the pure fractions afforded the product as a yellow crystalline solid (7.83 g, 37%) which had: mp 109-110 °C; NMR ( $\text{CDCl}_3$ ):  $\delta$  4.52 (s, 2H), 7.24-7.30 (m, 2H), 7.40-7.52 (m, 4H), 7.58-7.65 (m, 1H), 7.86 (d,  $J=10$  Hz, 1H); MS (FAB) m/e 294 ( $\text{MH}^+$ ).

PREPARATION OF 3N-ALKYL-2-ALKYLQUINAZOLIN-4(3H)-ONES

35

A general procedure for the synthesis of 3-N-alkylated-quinazolin-4(3H)-ones is given below. Chromatography conditions, yields, and spectral data are given for the compounds prepared by this procedure.

A suspension of 1.1 mmol of NaH in 2 mL of dry PMF at 0°C under nitrogen was treated with 1 mmol of the quinazolin-4(1H)-one as a solid (most quinazolin-4(1H)-ones prepared were insoluble in DMF). 40 Immediate evolution of hydrogen could be observed as the quinazolin-4(1H)-one was deprotonated and dissolved. After 30 minutes the solution was warmed to room temperature for a further 30 minutes. To this solution cooled to 0°C was added a solution of 1 mmol of either 4-bromomethyl-2'-t-butoxycarbonyl-biphenyl, 4-bromomethyl-2'-cyano-biphenyl or N-triphenylmethyl-5-[2-(4'-bromomethylbiphenyl)] tetrazole in 1.5 mL of DNF. After 30 minutes, the reaction mixture was warmed to room temperature and stirred 45 overnight. The solution was concentrated in vacuo, and the residue dissolved in 50 mL of EtAc. The solution was washed with water (3x10 mL) and brine (2x10 mL). The organic phase was dried over MgSO<sub>4</sub>, filtered and concentrated in vacuo. The residue was purified as indicated below:
